### **Abstract**

*Learning to overcome the limitations, is to face the circumstances that every human being finds in its natural interrelation, and especially with the duty it deserves to its environment. Facing the challenges, within the imperfect being, include positive postures in the dimensional of growing and glimpsing the material, together with the spiritual of the reasons that intuit the essence of a God that represents the whole and the smallest parts*

**Keywords:** *Environment, ethics, history, benefits, challenges*

### **1 Introduction:**

Each action and century bring its splendor or reflections, its events and adventures. The planet and its changes by natural and anthropic influences are successive stories that are renewed, arise between paths of its own dimension or, in practical study, are discovered and transformed into its intrinsic biosphere or by human intervention.

It is complex for humanity to remain conscious in acquiring the power granted to it (divine justice - material). Experiencing a change for the general good is part of the conditions, difficulties and possibilities that deserve to live with merits within the society that has been granted, in the sense of assuming with reason.

### **2 Legend and truth of events**

The planet has become a field of belligerence, a paradise with a port and open farmland for the game of power, enjoyment and property. Tragedy and directional dispersion arises, but the academies in their rationality fail to route what is required in supplies to clear the natural path that corresponds to a consolidated State.

The banner is of permanent usufruct and of slapping without solution that leads to chaos and pillage, an entire avenue that gives way to unknowns, privileges without merits in the sway of advances and arrears, legitimate irregular currency, differentiating its genesis. The responsibility of the behaviors must ensure decisions in their organizational structure, which provide satisfactory ideas and provide opportunities, cultural values in application of the theoretical.

In the social sphere, environmental pragmatism includes a diversity of relationships, needs that consider channeling power in alliances of democratic redistribution, characteristics in action representative of the various interests. Ownership, rights and irregularity of human activities, change and intensify by development, the situation requires more science and integration of disciplines.

The modern universal and environmental context with its nascent problems must rigorously evaluate and implement the orientation towards the State models and redefine the influence on their economic policy configurations and their social insertion, in order to transform with comparative feasibility measures and development environment protection. Well-known alerts with analytical deepening that seeks to consolidate ecological awareness to maintain the health of the planet.

To understand the world is to analyze its natural phenomena, scrutinize in its cycles of mother nature, study human behavior (with its projections, events and anxieties) and investigate the hidden and infinite spaces of the phenomena of the earth and inter-manifestations. -acts of being with its diversity, differences and modifications. In the same way, each existence - in its onticity - combines its theories of the natural environment and puts into practice its own manifestations constituted by concepts, judgments and reasoning, which put it to the test within its nucleus.

In the essential features, humanity with its actions and consequences of optimizing its use of resources, experiences different needs and, most of the time, unbalances with the demand for consumer goods, which generates changes in the environment and by adding waste that they become a negative environmental impact. Adopting an alternative and direct approach requires an administrative and comprehensive reform, based on experiences with risk assessment policies and functions, substantial to assimilate and correct errors with operational methodologies. Substantial improvements, jointly oriented by economic support.

Maintain a culture of resource protection in natural environments, linked to the potential stimulation of health. Use the language of knowing and understanding the damages to health due to contamination, or the responsibility that should be taken in not causing damage to the land, water, air, flora, fauna, location and reuse of waste. The general characteristics of the mission in life, effects and control with incorporation of legal provisions.

Train, in order to avoid ignorance of basic measures such as permanent deforestation, burning, excessive industrial production -only mediated economically-, intensive monocultures, among diverse and express natural resources that are depleted and require administrative tools, preparation and strategies such as livestock without technological control of soils and basins (endless lists to emphasize and recognize in each disciplinary field).

### **3 Integral culture**

The environment includes having a legal preparation, approaching the laws. Know that the damages that are caused are a natural logical object of mandatory compliance, protection and sanction for environmental law. Important practical knowledge as an instrument and effective guide to solve the pressing problems of the environmental theoretical and practical field.

The performance of social life and making its day after day more comfortable, has been of high technological and artificial progress. There is a certain lack of ignorance and the present world is approaching a certain paradoxical vision, essentially to protect the environment with harmony and respect its cycles. In his reasoned inference to harmonize with society and the environmental nature, he understands the inventiveness of seeking high quality of life, but a good percentage of the improvement is

encompassed by the technology out of focus in a society of industrial service, of sumptuous utility projected in an extreme consumerism.

Knowledge and the high and unlimited perspectives in the vital direction of the environment and health are significant. Find guides in the modern transition, discern, confront and resolve the health of the planet in an ethical reason. However, the variety of factors incorporated into the human environment is alarming, limited to the uncertain and unsatisfied needs that lack understanding, power without meaning of solution, the changes in development in many opportunism and economic concentration of few, comfort and the technology.

The process must be an effort of mind and meaning, study and teach in the praxis exits at the crossroads. The first steps are already taken to confront pollution with clean energy, identify and change, start the transition as it has been the everlasting footprint of past generations, the industrial increase, of private, public and cargo vehicles with their polluting fuels of 'particulate' material.

Alerts are a constant reality, measured by air quality monitoring networks such as carbon monoxide, affecting the ozone layer, and sulfur and nitrogen dioxides. The way of assuming the same natural phenomena are the constants of modern thought that require explanation and solutions, an effort by society that guarantees quick and viable actions in their differences. It is the now or moment of identification and administration to assume the stages of development, optional internalization of spirit in the competitive, legal and practical that the concept of environmental intelligence requires.

Perhaps the path has not been taken due to lack of guidelines and policies of roots, also because people have remained anchored, immersed in their habits, and in many cases the consolidation of favorable criteria is not due to lack of a culture that promotes change economic, rehearsal and support for inquiry, to protect mother nature. A new universe? The situation is clinging to creative minds, formulas that they believe propose the right guideline and pay for meaningless distraction and the failure of what has been paid in years of effort.

Many times, due to incipient customs, there is no channeling of benefits, since in some cases urban entities and societies are diminished and influenced by false addresses, confused by the inconsistencies of daily work, administrations are only committed to the excessive exploitation of resources where they do not they reach the regulatory controls for the regional, and also for the centralized benefit of the regencies, for urban and personal priorities, without glimpsing the essence of the minimum environmental impact.

If the issue of integrated development is taken, as a basic priority in social and inequality problems, they must belong to a very new agenda, on research and planning of the natural environment, regional and urban environmental quality implemented by public policies, with its diverse project contexts in globalization and dissimilar realities, in actions for historical memory. They are facts of the sensitive deductible experience, but in contemporary spatial and social cohesion, the truth of the argument that is to think and create cannot be left behind (innovate, adapt in daily transformation and with the appropriate ethical competence in the just mental and physical measure of the needs), to avoid the minimum detriment in the environment.

#### **4 World Reasons for the Disaster**

An effective instrument, to face the depth of the environmental problem with its background, is the undoubted economic cost that must be assumed in the capital venture to counteract and begin to reduce the effects of pollution. The observable opportunity of the surpassed and the unavoidable commitment of the countries to provide dedication and knowledge. A reasonable offer not to regret the coming populations.

To undertake the rigorous advice of economic commitment, in environmental needs, is consecutive to understand the double cooperation in participating in what has been learned and what has been stopped executing for past periods. Support for Mother Earth is already an acknowledgment of energy that makes humanity feel free to share it.

The exponential scheme of atmospheric pollutants is unquestionable, and the health impact caused by the proliferation of various wastes: involvement of permanent volatile elements in the atmosphere, air pollution by fossil fuels, power plants, industry and sewage in contact with every living being and nature, aquifers, rivers, sea, land, whose only outcome is the substantial increase in diseases.

The succession of the environmental issue is understandable in every basic text, the survival between the unlimited capacity to generate pollution, the consequences of the (in) variable deterioration caused by hyper-consumption, population growth and progress of human activities. All the paths undertaken in global history congregate the reasoning of its past, movements, elements of its progress, natural majesty and also the loss of its reserves as an ecosystem. Jungles, hills, aquifers, snowy, need to determine the deterioration and the appetite of finding solutions to its support.

Colombia and its snowfall are reference points, affected by the anthropic intervention and the already manifest global warming that travels the world from south to north, in all its axes and angles. In the descriptive and historical story of the *Pilgrimage of Alpha*, Manuel Ancizar expresses his direct semblance of the Sierra Nevada del Cocuy and some of his winged beings, symbol, that swarmed in his territory. Today, the gigantic cusps degrade, heights known as the six glaciers or snow-capped mountains: del Ruiz, Santa Marta, Santa Isabel, Tolima, Huila and Cocuy, continue in clear decline of their perpetual snows.

As we were approaching Alto del Cocuy (3,800 meters, temperature 9 Celsius degrees at 8:30 am), the vigorous vegetation disappeared, leaving in place the resinous dwarf shrubs, grasses and mosses, until

finally crowned the height, we enter the exclusive region of the frailejón [...]. The loneliness and deep silence of the place, the huge bare rocks that rise everywhere in the middle of the ruins of hills prostrated one on top of the other, mixing their powerful remnants thrown over a long distance, the dull and sad sky through whose space turned large vultures and some condor with the majesty of the lord [...]. Ancizar, p. 226

Thinking people without differences deserve natural Providence, to break down myths for sovereignty and liberation, in search of impacts to order, not only to the capital of the emancipated market. In the exceptional, the only tie includes the free sense of reconciling and pressing ethical support, benefiting it from life, character and courage, as what being in its essence is, one more cell; not only thank the inspiration and express verses that introduce the conceptual, prove that the spiritual direction is in the work that has been stopped and, the true bio-ecological foundation is about to start, with the affirmative contribution of removing and resolving with smart alternatives the impacts that afflict you.

In the logic of the uncontrolled technological expansion, and the care for the minimum environmental detriment, justifying it with its organism of ideas called science, dazzles the novel activity; In his understanding of adapting to the world and observing as a guest and without functions overflowing growth, it is divided into differentiating criteria and multiple formulas that remain in theory. Posing the concepts is no guarantee of bringing the designs and the inspirational ships of recognition, with their load of probabilities, to a good port and shelter.

Feel, want and approve human protection, in the first instance joint recognition and welfare for natural resources, non-renewable that are depleted. Prepare in the culture of conserving, restoring, reviewing the effects of use and importance of forest and wildlife areas that promote environmental quality, conservation of ecosystems and life.

**Figure 2.** Sierra Nevada del Cocuy (Los Pumas, 4,150 meter above sea level). Vestige and path of the guides. Author: Daniel F. Peñaranda F.

In the consolidation and economic execution so that the environmental projects are viable, the majority remain orphans, either due to a shortage of contributors, due to the ignorance and foundation of models or in the focus to make them practical and materialize them. Likewise, without the guideline and financial support the weakness is present, the proposals are short and unreasonable to ensure their sustainability, in the foundation required by the natural environment and its minimal impact.

Vulnerability is by acting without an interdisciplinary guideline (absence of reasoning and direction in science for integration), by not seeking mediation of institutional levels, social, human capital and resources, public policies in environmental reintegration. The control of societies in constant growth, of great consumption and polluting waste and insufficient deposits or the vertiginous lack of control of harmful chemical products.

A complex background system is that population density, the constant transformation of the natural state of urban and regional lands, by large estates according to exploitation or anti-technical provision, which require more livestock resources and extensive monocultures and agricultural inputs, without rotation until the depletion of aquifers that become desert systems. The dilemma of science in the storm and drama of life, raises changes in the foundation of environmental knowledge, induces being integral to economic, social, natural and physical disciplines. The call that corresponds to the inheritance is refreshed, interdependent with the order of its four natural elements, air, fire, water and earth, humanity adds its greed, unease and insatiable tribulations for its own benefit.

The different studies are inclusive of the shortage of housing and demand, to affiliate and improve the conditions of fragile life. A coherent relationship between society-nature; the ecological incorporation of dimensional conservation for the projection of city-industry-region, needs to be revitalized of economic operations and reflexive commitment of knowledge and transformation. To cover the environmental order is to establish ethical links, regulate and incorporate legal concepts and disciplinary sciences, in order to talk about construction towards the new generations.

In the appropriate management of establishing conclusive criteria, determined of integral environmental recovery, in the search of not generating degradation, pollution, and the equipment of being able to transform the waste product into an object of lucrative material, with the focus of reusing it, it seems to be the characteristic sign of the perennial experimental signal. It is the thought in formation and even with certain incongruities, to implement it in all the work of industry and technology, with the rational success of lasting or evolutionary base that requires the administration of natural resources.

Above reason the greed and indifference that leads to breaking the fragile order of possibilities and progress in the relationship and human action are taught. The desolation is transferred to seek justice, to legitimize elements of authority to face the violation of the norms. Peñaranda, p. 95.

Society studies and demands in the field of ethical commitment the formation, action, conservation and preservation strategy, so that it is compatible to articulate and dimension the ecological, economic and social. It is understood that it is on that same scale of existence that makes the difference between the selective and practical will to combine protective progression activities to overcome the primary and animal, in coherence of its complex system. Efforts should guide objectives, plus technological solutions in the order that characterizes the stability of the social group.

Survivors and dispossessed who have not reached their ideal, make up most of that common object of relationship and study. However, in the era of progress, of the incontrovertible benefits and pollution, this paradox arises in which the wake of outrage (the social order and its common needs) is observed, and as the senses sharpen the nostalgia for the unstoppable sacrifice of the natural pantry.

## 5 Open promises to appropriate

The discipline of knowledge leads to discovering interests in power relations, the environmental and its resources are not exempted, they have enough room for profit that constitutes unavoidable potential in this area. It requires incorporating its complex dimensions into a unit of science and a comprehensive strategy of cognitive effort.

In the implementation of world-environment care and that included detecting curious common environmental affection, there are the other cultural faces and collective interactional history, the non-returnable transforming anthropic footprint. Knowledge and its relationships appear, however, in the universe of the sensible any corner of the Earth produces the exaltation of the spirit, which includes the emerging reflection. The real relationships and differences condition and induce to build new styles and progress in the environmental relationship.

**Figure 3.**Sierra Nevada del Cocuy (Laguna grande, 4.400 m s n m.). Source: Daniel F. Peñaranda F.

On the banks of material and environmental wealth, the choice of knowledge well denies itself. Inappropriate practices build the extinction of natural reserves, such as the planting or renewal of forests by foreign species, and without direction to regulate distances or appropriate fertilizers and insecticides; It is controversial because of the ecological balance. In the technical provisions of applicable law, possession must include what is regulated, but in the value of productive-economic benefit, there is also discontent in the concept of conserving.

The wealth of the inheritance is in the guard of ancestral transmission; its cultural guide of significant action exists in correspondence of contributing to the universal heritage. The faithful knowledge of favoring, an effort towards the future of the communities, to guard with gratitude in hovering the cares and contributions of past humanity.

Freedom, dignity, gratitude and interest to preserve, are premises of redemption for the emotion of that which is natural and seizes the senses; by antonomasia to the previous thing, in antithesis is the extinction or usucapion. The smallest thing in life is worthy of protection, inspiration and admiration, altering is

anti-value, spiritual interiority is obscured by sadness, blushing and disappointment. The common knowledge must place towards a socio-environmental task.

When considering the continuous degradation of habitats, evasive or indirect, which without ambiguity causes it to be, it is the detectable imprint of the error (wherever humanity has stepped on its residues contrast), the vestiges and spoils not gratifying stimulate to differentiate the approach of responsibility. The thematic universe includes the interests of social power and to guide, transforming the construction of the equity of the environmental usufruct.

Being, in the instance of its set of inadequacies, abundant needs and little participation, constitutes instability when it is not a decisive part in integral management. This situation creates an inevitable environmental change of magnitude and, likewise, this chain leads to the deterioration of all ecological systems and global warming. Regulating the conditions of management and consumption of natural resources determines progressive integral educational creation, its approach characterizes the property relationship in its correspondence of principles and values of natural and social order, patterns of use, production and specific, natural and technical intervention.

Regarding environmental laws, it is necessary to consider the operating system of the central and local agencies, or the programs that are delegated to the States, to maintain the supervision and control of methods in natural and environmental resources. Likewise, the regulations that exist for water bodies and sewage discharges are mandatory in various countries; However, the main law of compliance and fundamental inherence is the commitment to the regulated and social responsibility as the main vedora agency.

As principles of regulation in pollution, waste, resources and water quality, of *what we all want to know about the environment and the laws of Puerto Rico*, in what is established by its operating system, are related in terms of protection policies, which already they are of general knowledge:

Human, domestic and industrial waste must be treated before being discharged into water bodies. Otherwise, waste pollutes water and prevents water bodies from being used for recreation or human consumption due to their high potential for disease. Similarly, pollution causes damage to ecosystems that depend on water, including fauna and flora. López-Feliciano, Diana, p. 61.

Contingency studies, and science itself, are concerned with counteracting the incidence of these phenomena, on how to stop warming in its escalation of uncontrolled. In this knowledge, there is no significant general behavioral change, or effective transformative multidisciplinary documentation, to analyze the shortcomings with frank reciprocity. Rather, the lack of proposals is characteristic of abandonment, since the low social inclusion in the explanatory of ecological conditions, contributes without preamble to environmental collapse. This sense establishes a crossroads of questioning the existing instruments, to seek the balance of resources in their natural environment and the behavior models demanded by humanity.

The relations of prototypes without norms and the dominant traditions of proceeding and daily ordering, lead to legitimize interactive strategies in the complex disjunctive action that environmental control requires. The native resources and their genetic modification are part of the 'advance', in the unstable interventional conservation of the vertiginous productive demand, it is an emerging work of significant interest and intervention in the awakening of social behaviors. To build in bioethics science the diverse behaviors of the social-natural environment (urban groups in their diversity, elites and levels of power), means to regulate; certify procedures of the just protective and equitable dimension of use, typical of the purposes caused by the domains of the incorporated economic value. Correct, avoid, improve, establish and comply.

The human separation of natural and external reality, to analyze the biological conditions and all the effects of climate change with its periods of droughts transcends throughout history. Anticipating the scenario of future conditions with their nutrients is also their commitment, because in the consensus of the logical reason everything is connected, mountains, rocks, hydrology, external and underground aquifers. This merger is part of the hybrid of circumstances that justify a global trouble agreement.

In assessing the environmental impact, the prospective in the valuable integrity of the chain merits correcting illegal extraction activities. For sectoral cases in Colombia, complaints about mining operations, specifically gold deposits, illegal laundering networks to legalize international transactions are recurring (El Colombiano newspaper, November 4, 2019). Mastery and damage add up as a few isolated factors - erroneous - they are sustainable of indiscriminate use and recourse (permanent variable) for pressurized technology without jurisdiction and little legal control for evasion or of difficult access for being areas of permanent armed conflict. There are also other aggregates already described, in the weight of how to get rid of that irrational burden, the roots of customs and cults, practices of obligation and primary tribal innocence.

With all the need for order, despite the laws adopted, it has not been possible to curb the civilization condition of living together, more stable belonging, with alternatives to counteract the minimum impact, stop it in the articulation consolidation and perfection of strategies viable. The approach of other methods, comprehensive administrative coordination plans, for the intervention of use in the ecological, regional and urban environmental structure must be addressed.

## 6 Conclusions

To feel proud is to find the fiery spirit to become an integral and authentic part of the universe at the end of the day. Righteousness is the celebration of justice, such as rest, rain or sun that benefit, feed and illuminate.

Health in the name of Divine Omniscience, complemented by human wisdom, are the ethical instruments of acclamation that must be contained on Earth within the reach of all parties. Fair inheritance, so that with the intelligentsia they resound in the orb and illuminate the shadows that the human race has implanted, in rescue of life and beyond death
